

MINERS WITH THEIR CANARIES

“Canaries are very sensitive to carbon monoxide. The canaries would chirp and sing and make noise all day long. But, if the carbon monoxide levels [or other toxic gases such as methane] got too high, the canaries would have trouble breathing, and maybe even die. When the canaries were

no longer singing, miners would know that the gas levels were too high.”

Plants and animals, insects, are warning us about wireless radiation. Up to 30% of us are already having symptoms.

KRH, on behalf of all 'canaries'
