

# NEW STUDY: MORE CELL TOWERS LINKED TO HIGHER DEATHS FROM CANCERS IN BRAZIL

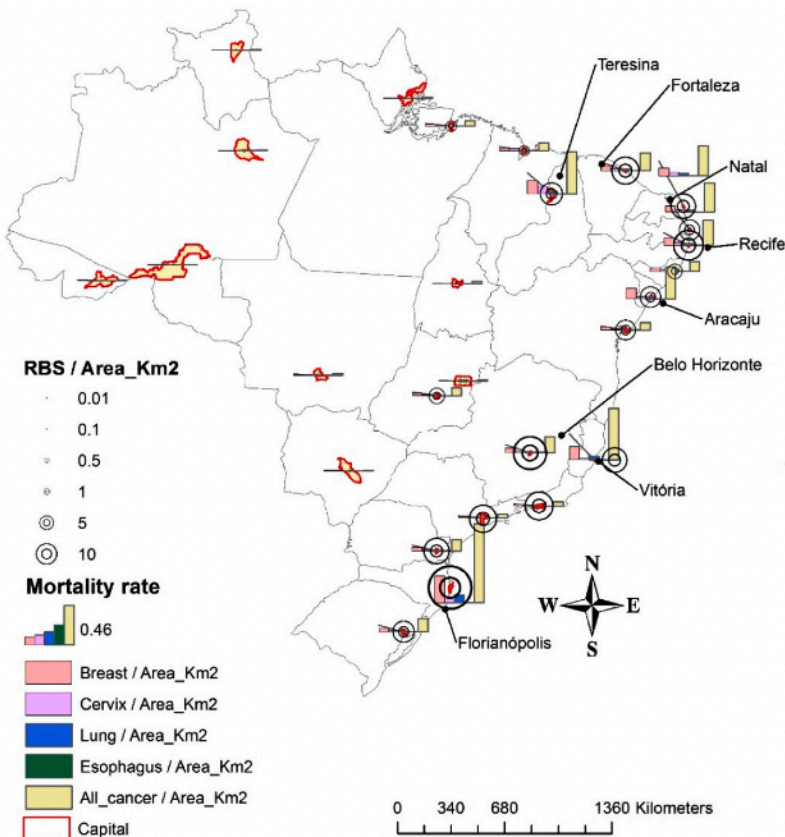

January 29, 2021

<https://ehtrust.org/new-study-more-cell-towers-linked-to-higher-deaths-from-cancers-in-brazil/>

The map below shows the distribution of the cancer mortality rate in each capital (outlined in red) and their experience of exposure to radio base stations radiofrequency, 2010-2017.

- ☉ Bulls-eye symbols show the zones of cell tower radiation.
- ▮ Vertical beige bars show the cancer death rates.

We see that the rate of deaths from cancer is significantly higher in the radiation zones, and they are more where there is more tower radiation.

## CELL TOWERS and CANCER DEATHS

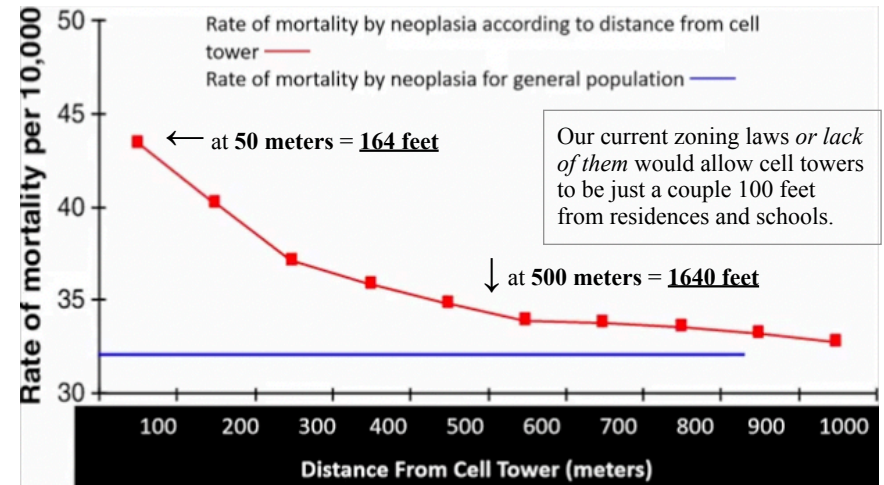

Mortality by neoplasia [Cancer] and cellular telephone base stations in the Belo Horizonte municipality, Minas Gerais state, Brazil <https://www.sciencedirect.com/science/article/abs/pii/S0048969711005754>

"FINDINGS: Between 1996 and 2006, 7191 deaths by neoplasia [cancer] occurred and **within an area of 500 meters from the base station**, the mortality rate was 34.76 per 10,000 inhabitants. Outside of this area, a decrease in the number of deaths by neoplasia occurred.

► Measured values stay below Brazilian Federal Law limits that are the same of ICNIRP. ► **The human exposure pattern guidelines are inadequate. More restrictive limits must be adopted urgently.**"

The blue line is the overall cancer death rate.

The red line and dots shows that closer than 500 meters is TOO CLOSE.

"Is it just bad luck that a young man who has been using his phone for hours a day since age 8 is diagnosed with deadly brain cancer at age 23? Or that a 21-year old young woman suddenly develops multiple breast cancers directly under the antennas of the phone she had stored in her bra? Or that a 24-year-old develops rectal cancer close to his blue-jeans back pocket now stamped with his phone's faded outline? "
